

# LAN Based Electronic Lock Management System

- Lock programming time management is significantly reduced through remote system administrator
- Tracked access for system management and data evaluation
- Unique user identification
- In room Proximity Systems compartment control for medications, supplies, etc.

SIMPLE. STREAMLINED. TRACKABLE.

Proximity Systems' patent-pending LAN Based Electronic Lock Management System simplifies and streamlines administration by remotely allowing management of user and lock information while offering important audit and report data.

The system combines hardware components and proprietary client/server software with an intuitive user interface for administrators to add, delete, or modify user and lock information from a central location. In addition, the software has a searchable and sortable reporting capability and offers administrators information about who accessed the cabinets at what time. The hardware includes a keypad, lock and control box that connects to the PC, eliminating the need to run additional cabling.

To learn more about the locking system for new installations, or about retrofitting older workstations, contact your sales representative or call Proximity Systems at 800-437-8111.
